If you survive sudden *cardiac arrest*, your doctor will try to learn what caused it to help *prevent future episodes*.

This procedure opens blocked coronary arteries, letting blood flow more freely to your heart, which might reduce your risk of serious arrhythmia. A long, thin tube (catheter) is passed through an artery, usually in your leg, to a blocked artery in your heart. This catheter is equipped with a special balloon tip that briefly inflates to open the blocked artery.
